

At last US admits human activity is main cause of global warming

At long last, the Whitehouse is admitting what the rest of the world has known for years. Professor John Marburger, president Bush's top scientific advisor has come out and said that it was more than 90% likely that global warming was caused by mankind and that the Earth may become "unlivable" without cuts in CO2 emissions. Prof. Marburger told the BBC: "I think there is widespread agreement on certain basics, and one of the most important is that we are producing far more CO2 from fossil fuels than we ought to be... And it's going to lead to trouble unless we can begin to reduce the amount of fossil fuels we are burning and using in our economies." He went on to say: "The CO2 accumulates in the atmosphere and there's no end point, it just gets hotter and hotter, and so at some point it becomes unlivable."

President Bush has yet to accept that human activity is the cause of global warming, the furthest he's gone so far is to say that human activity may be a contributory factor in global warming, which is to a great extent reflected in his policies, or lack of policies on reducing US CO2 emissions. The world's biggest contributor to climate change gas emissions is in denial, what hope have we got?
